Atlantic Salmon Stressor Analysis – Norway

CNL(25)40

Presented by Peder Fiske

Norwegian stressor analysis

- Performed by Norwegian Scientific Advisory Committee for Atlantic Salmon (SACAS)
- Yearly assessments
- Expert judgement by integrating information from individual rivers
- Evaluate anthropogenic stressor (thus predation not evaluated)
- Confidence evaluated from low to high

Threats related to salmon farming and climate change rank highest

Pink salmon «on the rise» but confidence related to effects and development is low
